Objectives

One treatment of thromboembolic disease is **transluminal angioplasty with stenting**. There are currently two types of stents : bare-metal stent (*BMS*) and drug-eluting stent (*DES*).

⇒ Our objective is to analyse globally the evolution between **2011 and 2015** of number, kind and indications of implantated stents in the Centre Hospitalier Intercommunal of Poissy St-Germain (CHIPS).

Methods

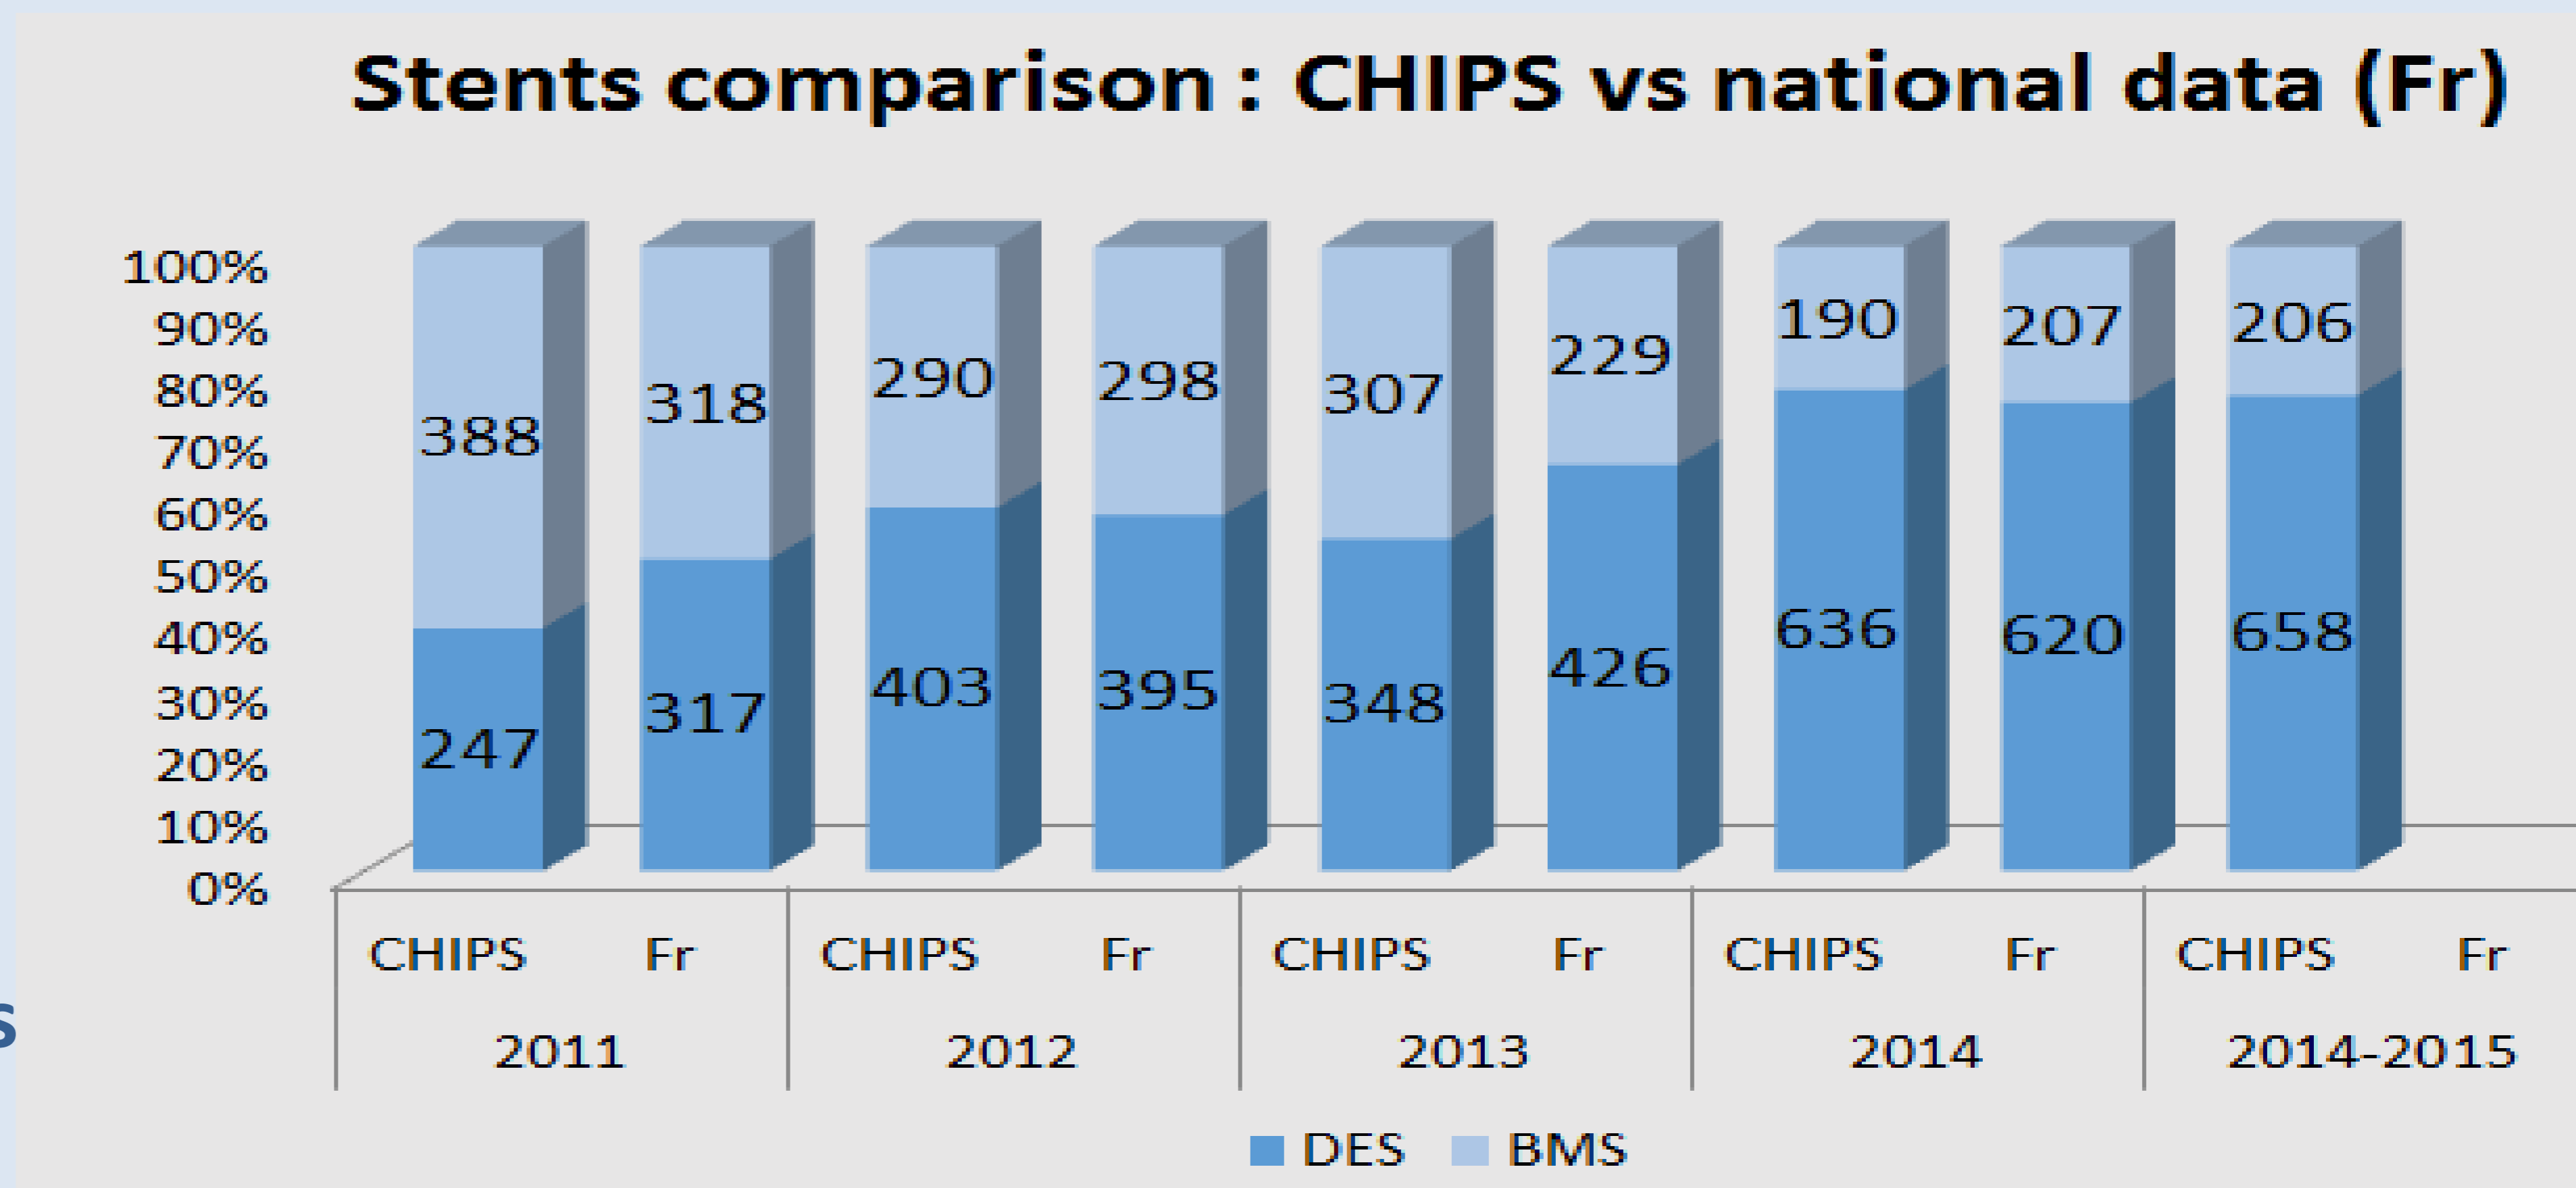

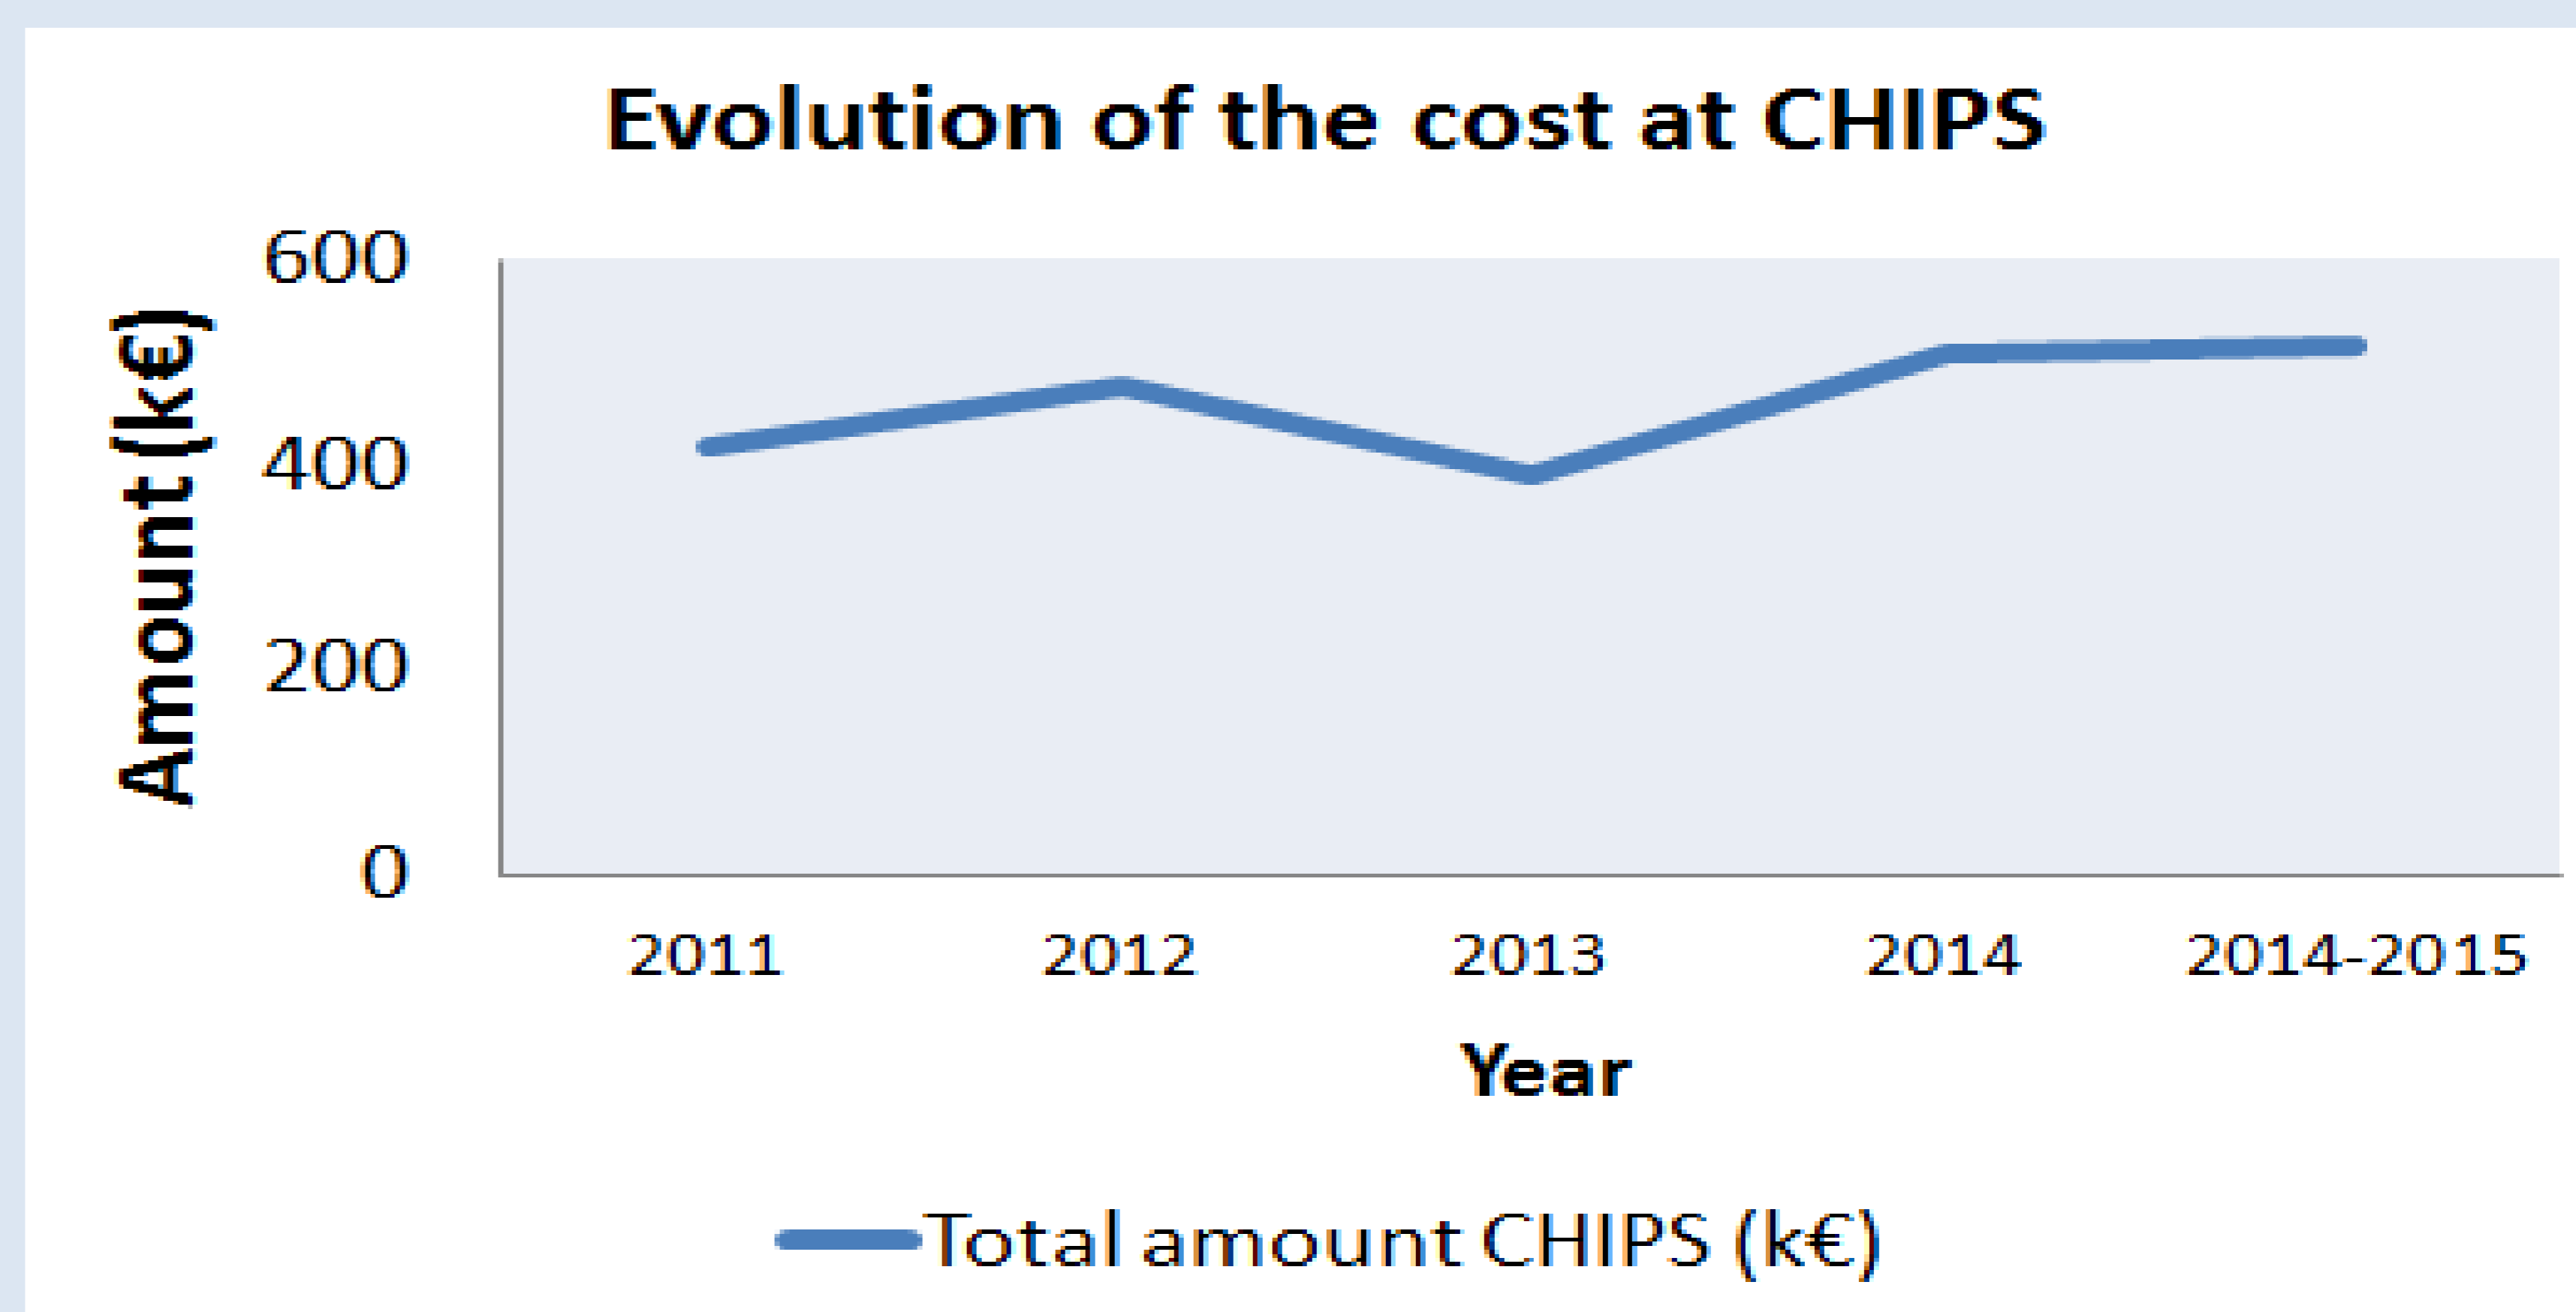

Results - Discussion

	2011	2015
Number of stents including DES	635 including 38% DES	864 including 76% DES
Number of patients	461	604

	2011	2015
« Off-labels »	18 3,6%	4 0,9%

Analysis of indications has shown :

Conclusions

In France and in our hospital :

- ✓ increase in the stenting number, in particular DES
- ✓ extension of the use of DES, leading to increased costs
- ✓ awareness on the respect for recommendations and indications by prescribers

IN THE FUTURE ⇒ new stents with bioabsorbable polymer and fully dissolving stents

Acknowledgements

Many thanks to the pharmacy team of the Poissy hospital, and to the congress organizers.
